

Outbound Integrations

Puzzel Ticketing's Outbound Integrations or Webhooks are an excellent and powerful way of communicating with a third party web application. When an event occurs in Puzzel Ticketing, it triggers an action for a predefined message to be sent out to the Webhook URL.

For example: When the priority of a ticket changes, we can send out a generic or customised message to the registered Webhook URL.

This is essentially done in three steps:

- 1. Register a Webhook URL
- 2. Define the Schemas or the message to be sent when the event occurs
- 3. Create a Event rule and define the event and tag the Webhook URL and message to be sent when the event occurs.

Register a Webhook URL

To register a Webhook,

1. Go to Settings -> Integrations -> Outbound Integrations -> Webhooks

puzzel. * Stationard Tiskets Reports Activity	C Ø		P Tichet #	E 🦉 🚮
Search	Senaral Tisket Channels			٩
C Webhooks	Produktivity P Tilelist Attributes + Integrations + Salesforce		•	New Webhook

WebhookSite	https://webhook.site/10667a6fe2t0-4722-8dee-249579ar31aa POST Bearer Tokee			
WebhookSitebasic	https://webhook.site/10667a6f42t0-4722-8dee-249579as31aa POST Basic			

2. Click on

🕀 New Webhook 🛛

button on the right to open the New Webhook screen

 Enter the Webhook URL, name of the Webhook, Method (POST, GET, PUT, PATCH, DELETE) and Authentication Type. Authentication can be Basic or Bearer token type depending on the destination URL. If no authentication is required, you can choose None from the drop-down menu. If you have configured a Response Mapping, you can set this here, so that a returned JSON response variable can be mapped to a category or form field. See '<u>Response</u> <u>Mapping</u>' documentation for more information.

Key2	***	ŵ
New Attribute Name	New Attribute Value	• 🔒 🛨

- 4. By turning on 'Enable Encryption', you encrypt a value into the custom header. Once you have entered your value, click on the open padlock icon, then click on the green plus button. The value will be encrypted and the unencrypted value is no longer accessible. When the webhook triggers, the encrypted value will be decrypted and sent to the external integration.
- 5. Click Save to register the new Webhook.

You can edit/delete the existing Webhook by clicking on the edit/delete icon against the Webhook.

Define the Schemas

Schema defines the body of the Webhook. This is defined separately to allow you to send different schemas[messages] to the same Webhook[destination URL]. To create a Schema,

1. Go to Settings -> Integrations -> Outbound Integrations -> Schemas

ouzzel.	n ashboard	Tickets	Reports	O Activity	C Settings	() Help			P Tokes 3 🕀 🎦 🚺
Search					General Ticket Cha		•		٩
Schemas					Productivit Ticket Attr	ty Ibutes	•		2
					Integration	15	, Salesforce Puzzol		🕀 New Sohema
Name							Outbound integrations	Content Type	Actions
15-Apr-2021 Schema JS	UN						>Schemas	NURL	
15-Apr-2021 Schema Te	502							Text	(2)
15-Apr-2021 Schema XM	ML.							X3/IL	🖻 🕥
Message 1								Text	C 😫

2. Click on the

icon to open the Schema Details screen

3. Enter the Schema name, Content Type and the body of the content. Content Type can be of Text, JSON, XML format.

me	
Message 1	8
intent Type	
ext	
intent	

4. Click Save.

Note

You can also use placeholders in the Schema content to dynamically replace the body content with specific attributes. For example, {{ticket:ref}}. This will change the placeholder content with ticket reference number when the message is being sent. The format of the Placeholder is {{\$MODEL:\$ATTRIBUTE}}. To know the entire list of placeholders that can be used here refer to <u>Placeholder</u> article

Create Event rule

Event rule can be defined to create a trigger for the message to be sent to the destination URL if an event has occurred. To know more about the Event rules and how to create them, refer to the <u>Event Rules</u> article. To demonstrate the Webhook scenario, an Event Rule can be defined as shown in the picture below.

Ile Conditions						
all v of the following conditions	are met					
ket Event 🗘	is equal to	Priority Changed	÷ ×	temove		
Add condition						
Stop checking further rules if the cor	nditions of this rule are met.					
Stop checking further groups if the o	onditions of this rule are met.					
e Actions						
et Response Target				Webhooks		
et Resolve Target	(GPP)			Test Webhook	Message 1	=
				+ Add Webhook		

Add a condition which says, if priority of a Ticket has changed, then trigger**Test Webhook** and send **Message 1** to the URL mentioned in the Test Webhook. For demonstration purposes, we have included test Webhook site to show that Message 1

was successfully delivered when a ticket has changed its priority.

Note

1) Webhooks will only be triggered if the same combination of Webhook, Schema and ticket combination hasn't been invoked in the last minute.

2) If no confirmation of delivery is received from the destination URL, it will retry 13 times with an extended delay between each try.

3) There is no guarantee that the Webhooks will be delivered in the same order that it was triggered as it may not be successful first time round.
