Manage users with SCIM

For managing and provisioning users the open System for Cross-domain Identity Management (SCIM) API is supported.

SCIM is a REST-based API specified by the Internet Engineering Task Force (IETF) in RFC7642, RFC7643 and RFC7644. The API can be used to create, read, update and delete resources. In addition to managing the user identities, SCIM also have endpoints to discover its schema and other capabilities.
